

(a) rate weights

prompt

r_{km} $R_k = \sum_m r_{km}$

delayed

r_{km} $R_k = \sum_m r_{km}$

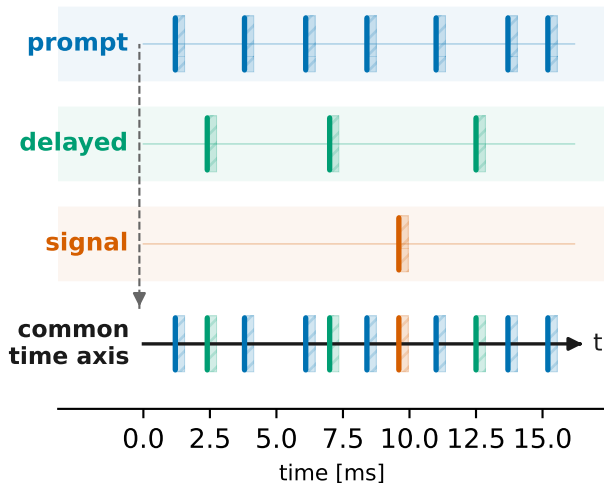

signal

r_{km} $R_k = \sum_m r_{km}$

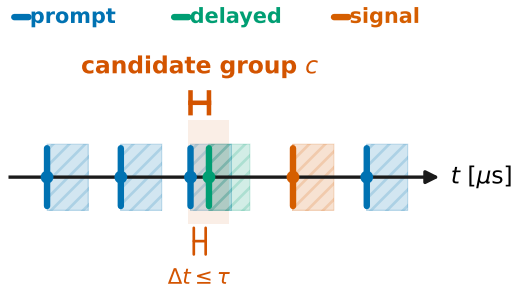

three independently
normalized catalogues

(b) Poisson merge

$N_k \sim \text{Pois}(R_k T), t \sim \mathcal{U}[0, T] \rightarrow \text{merge \& sort}$

(c) τ -grouping

background streams are drawn before veto;
focused signal is inserted as a conditional probe
